

Commercial Gas Appliance Rangehood Interlock

As many alfresco areas are being enclosed or semi enclosed, some gas appliances, mainly BBQs approved for outdoor use can no longer be fitted in these areas. However BBQs approved for commercial use can be installed.

There is a recent significant change in the gas regulations which will affect some gas barbecue installations. Appliances approved for commercial use, installed in residential premises, must be fitted with an interlock to the gas supply so that the installed extraction system/range hood is in operation before gas will flow to the appliance.

This versatile interlock can be easily installed by plugging the controller into a power socket and the extraction system/range hood power cord into the controller. A separate cable is then connected from the controller to a solenoid valve on the gas supply.

Turn on the extraction system/range hood and the solenoid is energized automatically turning on the gas. Turn off the extraction system/range hood and the gas supply is isolated.
